New! Crescent drill protection

The hardened crescent – a new and improved form of anti-drill protection, is now available with Mul-T-Lock's Euro profile cylinders.

The method has already been in use for quite some time in our smaller products, such as the 19 mm camlocks, file cabinet locks, and more.

The hardened crescent technique improves the drill resistance of all cylinders. Please note: the crescent must be put back in place whenever the cylinder is opened for re-keying or other procedures, since it is "free floating" – rather than pressed in – and will fall out when the plug is removed!

Since nowadays many of our customers work with unassembled products – it is important to make sure that the crescent is included in every order!

The crescent is supplied in bags of 100 pc. under P/N 51236316.

Cylinder bodies come ready with a special **groove**, into which the crescent is inserted during assembly.
